CORN PRODUCTION IN SOUTH DAKOTA, 1928-1939

- By Counties -

The acreage planted to corn in South Dakota during the period 1928-1939 varied from 5,500,000 in 1931 to 3,050,000 in 1939. The period also showed the most sharp extremes in yield variation in the history of the state. A severe drouth resulted in very low average yields and considerable abandonment in 1931, 1934 and 1936. In the intervening years since 1930, lack of moisture and destruction by grasshoppers held the average yields at much lower levels than normal for South Dakota.

The total acreage devoted to corn was not materially reduced until 1934 when curtailment of acreage in conformity with the A.A.A. program and drouth resulted in a decrease of more than one million acres. In 1935 and 1936 the planted acreage was increased, but since then has shown a decided downward trend. The shift from corn during the period 1937-1939 was largely to sorghums as producers sought a drouth and grasshopper resistant feed crop. The acreage in sorghums was increased from a few thousand to nearly one and one-half million acres during this short period.

Estimates presented herein cover corn for all purposes, including hogged, siloed, and fodder corn, as well as corn husked and snapped for grain. The yield for grain, plus an allowance for the grain equivalent of yields for other purposes, is included in the estimates of yield and production.

The acreage estimates are based primarily on data obtained through the annual state census of agriculture which were adjusted to state total estimates of the Crop Reporting Board. The estimates of production were based primarily on yields per harvested acre reported by crop correspondents. The yields per planted acre were derived by dividing production by planted acreage.

Evan V. Jones,
Agricultural Statistician
